Annual MOM Progress Report

2005

Submitted to EPA on February 27, 2006

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering such information, the information submitted is, to the best of my knowledge and belief, true, accurate and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

Partners Acting for a Cleaner Environment

A 10-year Program to Improve Our Waterways

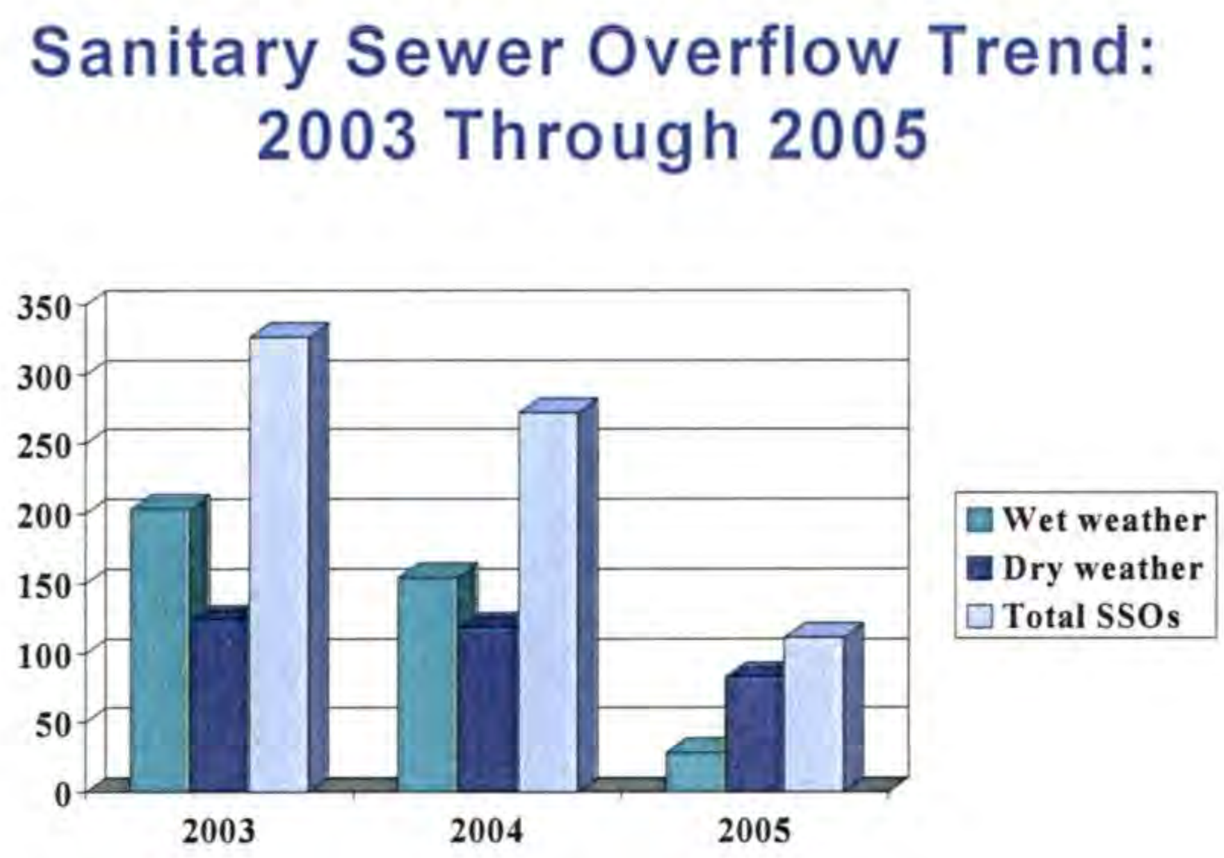
0001676

Table of Contents

Section 1: Introduction

KUB significantly reduced sanitary sewer overflows (SSOs) in 2005 through improvement projects and ongoing Management, Operations, and Maintenance (MOM) Programs. SSOs declined by 59 percent overall. Wet weather SSOs were down 82 percent, and dry weather 30 percent.

Although the wet weather SSOs decline comes partly from a combination of lower than normal rainfall and completed improvement projects, the decrease in dry weather SSOs links directly to KUB's continued emphasis on MOM programs. We expect trends in both categories to continue downward over the next two years (assuming normal wet-weather conditions of less than a two-year rain event) as we continue to complete improvements and focus on MOM efforts.



The above chart shows a significant decrease in overflow numbers from 2003 to 2005. [*Without the 115 overflows in February 2003, KUB SSO numbers would actually be trending down in 2003 from 2002. Heavy rains over one weekend caused flooding, mudslides, and street closures throughout the area and contributed to an unusual number of SSOs.*]

Dry weather overflows continued downward in 2004 from ongoing grease control efforts and from increased proactive basin cleaning. KUB outsourced Blockage Abatement (BA) efforts in 2004, allowing KUB crews to focus on systematic sub-basin–by–sub-basin cleaning. The BA Program increases the frequency of cleaning in areas with previous problems until KUB schedules projects for more permanent fixes. BA crews cleaned 747,138 linear feet (lf) and televised 170,877 lf of gravity sewers in 2005.

In addition to the BA footage, KUB crews and PACE 10 contractors cleaned 1,374,895 lf of gravity sewers in 2005 and televised 1,299,712 lf of gravity sewers. (PACE 10 is KUB's accelerated 10-year, $530 million wastewater improvement program to aggressively attack the

problem of sewer overflows. "PACE" stands for "Partners Acting for a Cleaner Environment.") The 1,374,895 lf of cleaning is more than double the 650,000 lf goal KUB had set for the year.

Under the PACE 10 program, contractors smoke-tested 1,175,399 lf of gravity sewers and conducted 4206 manhole inspections, with 452 manholes rehabilitated or replaced. More than 145,000 lf of wastewater mains in the KUB system were rehabilitated or replaced.

This first MOM Annual Progress Report, which covers the 2005 calendar year, includes an update on the Sewer Overflow Response Plan (SORP) that governs KUB's response to SSOs and how it communicates about SSOs. The main focus, however, is on the four major programs listed below that helped KUB achieve significant reductions in SSOs:

- Grease Control Program
- Continuing Sewer System Assessment Program (CSSAP)
- Infrastructure Rehabilitation Program (IRP)
- Gravity Line Preventive Maintenance Program (GLPMP).

KUB continues to implement, manage, and refine the Other MOM Programs listed in the Consent Decree Appendix A. Where applicable, any of those programs with changes or significant accomplishments are summarized in Section 7.

In August 2005, KUB launched a new Private Lateral Program (PLP). Under the PLP, KUB inspects customer-owned private laterals, notifies customers with defective laterals or prohibited connections, and enforces repairs. KUB tracks information about the PLP in a Lotus Notes information management system (IMS) called the Private Lateral Tracker. This report includes a summary of the PLP in Section 8.

KUB also developed and continues to refine another IMS that is referred to in several of the MOM programs covered in this report: the Collection System Maintenance (CSM) program. The CSM is an electronic record-keeping tool used by internal and external field crews. This multi-faceted program collects information for the proactive cleaning and condition assessment of system components. It also records the activities of the reactive crews, such as the Hot Crew and First Responders. SubCam software is used in conjunction with the CSM to allow operators to enter condition assessments during the closed circuit television (CCTV) inspection process.

Typical information included in the CSM includes tracking numbers, equipment numbers, the team performing the work (Standby, etc.), date and time, manhole information, pipe information, productivity numbers, and follow-up street or landscaping repairs. The manhole section of the CSM records the assessment during manhole inspections, including manhole IPID (an internal numbering system), latitude and longitude, manhole elevation, etc. It also tracks any Capacity Assurance Program (CAP) credit (based on location, such as riparian, non-riparian, or paved area). The line section tracks factors including smoke testing, CCTV, flushing, and root-cutting.

This progress report shows how KUB achieved a significant reduction in SSOs in 2005 through its MOM programs. It also demonstrates how KUB will continue to use and refine MOM programs in the future to better maintain our system, serve our customers, and protect our environment.

Section 2: Grease Control Program

KUB's Grease Control Program consists of three primary elements:

- Routine inspection of food service facilities (FSFs)
  - Existing FSFs
  - New/remodeled FSFs
- Grease-related SSO Response
- Residential Grease Control Program.

This MOM Progress Report section and the summary tables included in Appendix A provide an overview of the program's activities in 2005. The summary tables provide more detailed information about the elements of KUB's Grease Control Program. They give information pertaining to grease related SSOs, interceptor requirements for FSFs, the number and results of inspections, enforcement actions taken, etc. FSFs in the KUB service area are on a scheduled rotation for inspection. The FSFs included in this report are only those that were inspected in 2005. Each year we will add the FSFs inspected to form a cumulative list.

2.1 Inspections of Food Service Facilities

KUB inspected 384 FSFs on its wastewater system in 2005 and will continue to inspect additional FSFs each year. Because some of the 384 required multiple inspections, KUB actually performed a total of 963 inspections. KUB required 35 of the FSFs to install new traps or interceptors to help prevent grease-related overflows in their areas.

KUB identified two Knox County Schools food-preparation sites as major contributors to growing grease problems in their areas: West and Central high schools. KUB required each school to install at least a 2000-gallon grease interceptor (*see photo below*) to help prevent chronic overflows. KUB also put the affected lines on its BA Program for frequent cleaning to control grease until the schools completed the installations.

KUB also required Michael's Restaurant, which was contributing to a chronic overflow, to install a 1500-gallon interceptor (*see photo below*). Since that installation (and completed construction projects in the Papermill area), there have been no problems at the former chronic site.

KUB's Grease Control personnel also use a "sludge judge" (*see below*) to measure the effectiveness of grease interceptors at FSFs. The tool takes a core sample from the interceptor and measures the percent of solids. If the solids are more than 25 percent, the FSF is required to increase the frequency of its pumping schedule.

2.2 Grease-Related SSO Response and Residential Grease Control Program

The majority of grease-related overflows in the KUB system occur in residential areas. When such an overflow occurs, KUB initiates a Grease Investigation that includes making field inspections and sending information to residential customers.

Based on the location of the SSO, KUB uses the electronic mapping tool LandViewer to place a graphic polygon around the geographic areas upstream of the SSO location. That helps identify all wastewater customers that may be contributing grease to the SSO location. KUB then generates a report containing customers' names and account information.

KUB inspects commercial customers to verify their compliance with KUB's Grease Control Program. Residential customers are mailed a letter, an educational brochure, a *Can the Grease* can, and a refrigerator magnet to remind them not to pour grease down drains.

In 2005, KUB mailed 1890 grease letters to customers near 27 grease-related overflows. KUB also sent 1850 Can the Grease cans to residential customers. [Note: KUB does not send cans to commercial customers, which are required to have grease traps or interceptors.]

Section 3: Continuing Sewer System Assessment Program (CSSAP)

The CSSAP is a systematic evaluation of the entire wastewater collection and transmission system (WCTS) that also assesses capacity to support prioritization of the Corrective Action Plan/Engineering Report (CAP/ER) and the Infrastructure Rehabilitation Program (IRP). It consists of five key programs, each of which includes a method for setting priorities for determining where assessments are to be performed, a list of the tools and methods to be used to conduct assessments, and a performance measure to track progress.

The following table shows the elements of the CSSAP, priority criteria, assessment tools, and performance goal periods:

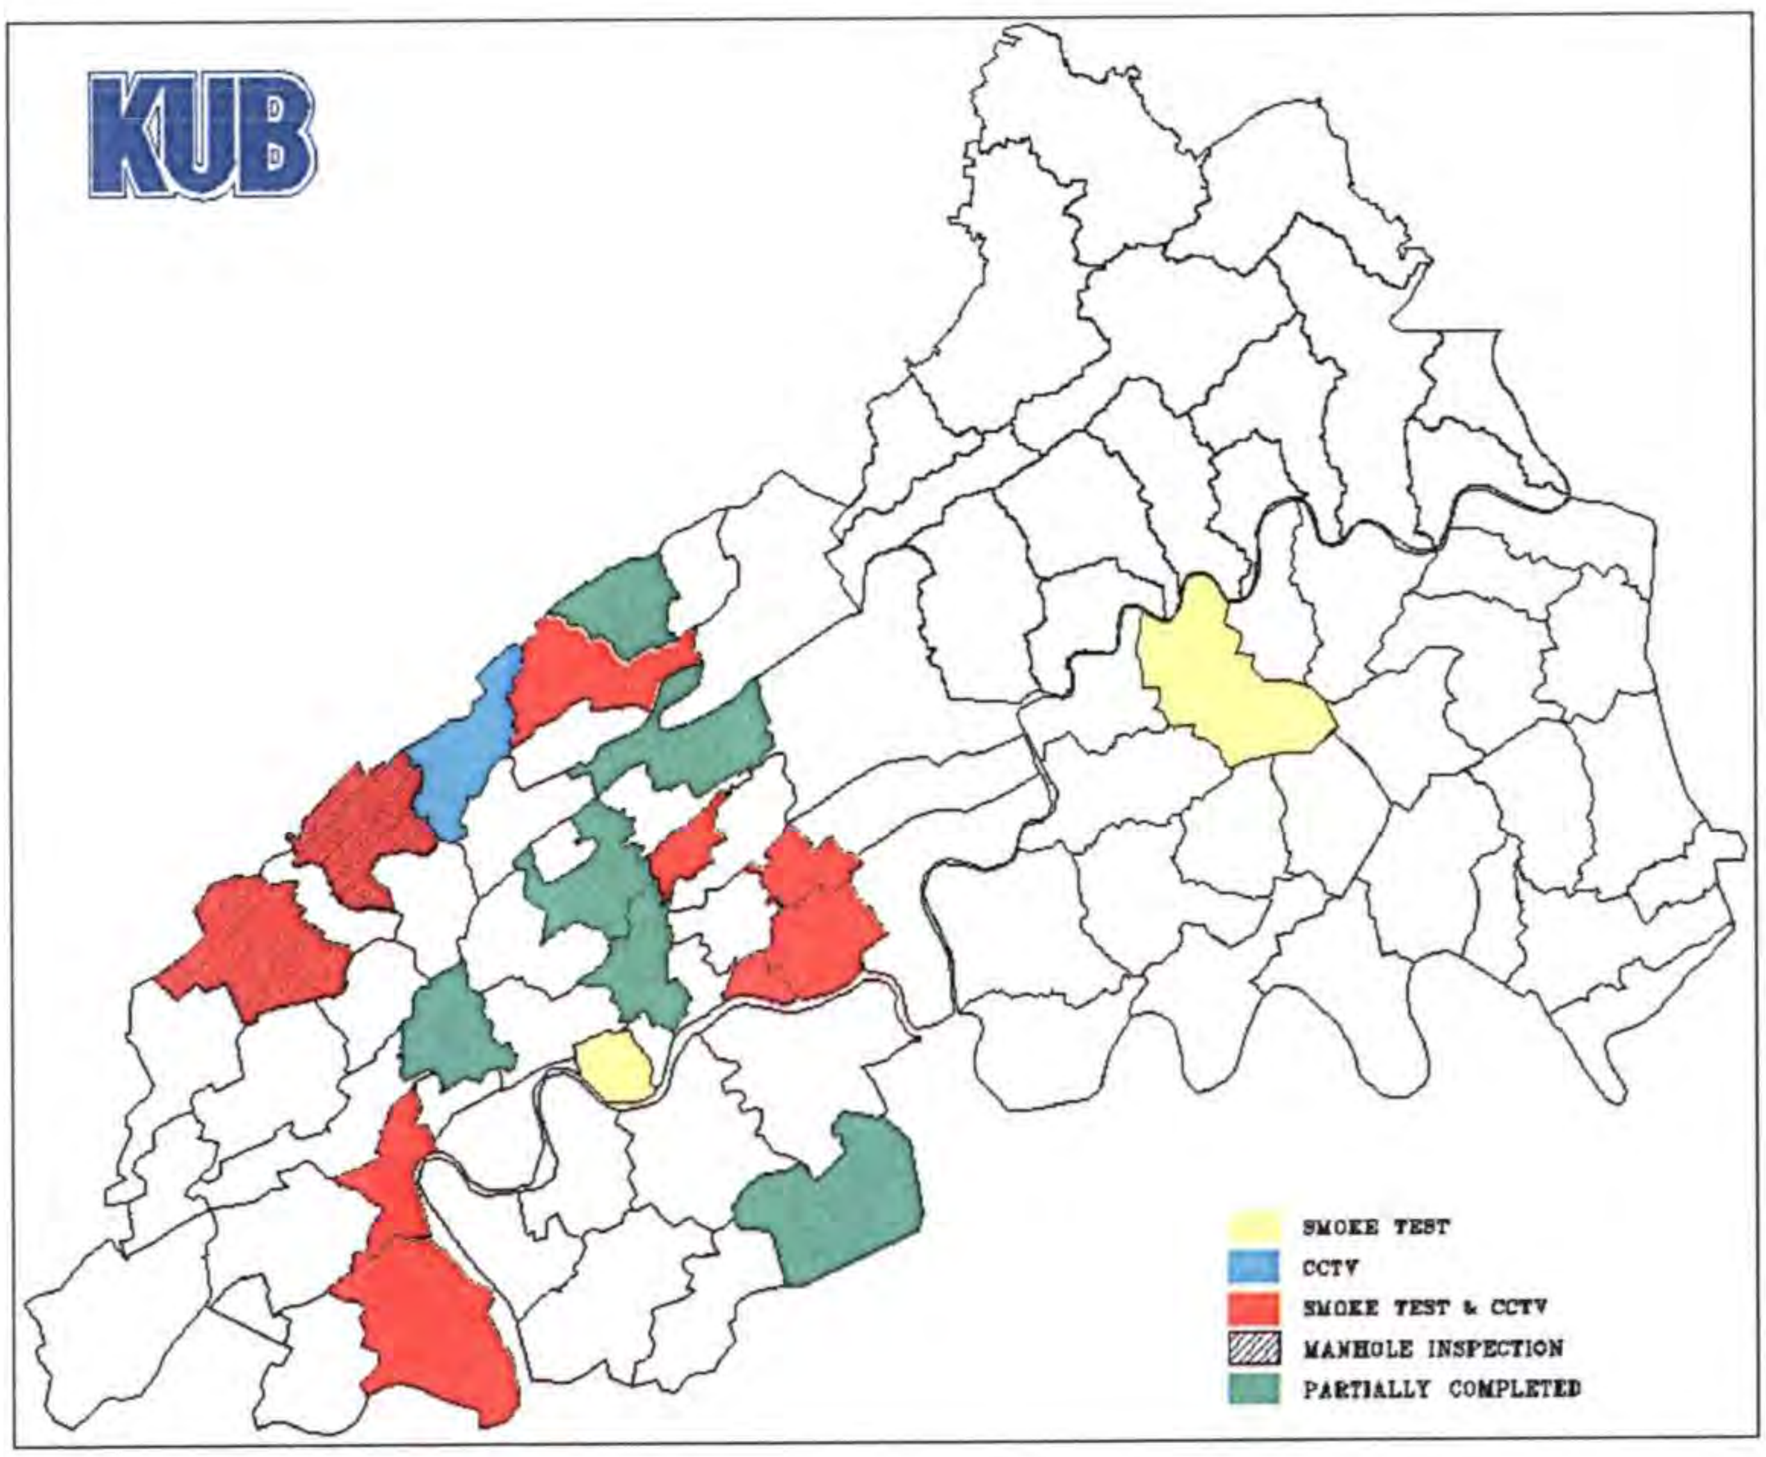
Program Elements	Assessment Tools	Percent Complete in 2005	One Complete Cycle Period
Manhole Condition Assessment	Manhole Inspections Smoke Testing	14 percent	12 Years
Gravity Sewer Condition Assessment	Flow Monitoring Smoke Testing Dye Testing CCTV	21 percent	12 Years
Private Lateral Condition Assessment	Flow Monitoring Smoke Testing Dye Testing CCTV	Smoke tested 17% of the system, which includes approx. 28% of the service connections	12 Years
Force Main Performance Assessment	Corrosion Defect Identification	68 percent	2 Years
Pump Station Performance Assessment	Pump Station Performance and Adequacy	38 percent	2 Years

3.1 Manhole and Gravity Sewer Condition Assessment

We are dedicated to completing one complete cycle of system assessment and cleaning in 12 years. Although the pace may vary in the future, several factors in 2005 enabled KUB to clean and CCTV at higher rates than anticipated. A light rainfall year, for example, made for good working conditions. KUB also supplemented crews' proactive basin cleaning efforts by using contractors to clean and televise six sub-basins in 2005. The map below shows sub-basins where comprehensive system assessments took place in 2005.

KUB, its contract basin cleaning crews, and PACE 10 contractors cleaned 1,374,895 lf of gravity sewers in 2005 and televised 1,299,712 lf. Under PACE 10, contractors smoke-tested 1,175,399 lf of gravity sewers and conducted 4206 manhole inspections, with 452 manholes rehabilitated or replaced. A sample daily program schedule is included in Appendix B. As part of the BA Program, KUB contract crews also televised 170,877 lf to ensure adequate cleaning.

The footage listed in this category in general is unique, first time cleaning and inspection. The repeat work performed in the BA Program is not included in this count. A small percentage (< 2%) may be repeated due to rework or need for more rigorous cleaning. This will be reconciled in the 2006 review of MOM work performed.



During 2006, we will reconcile the inspection and cleaning records from our 2005 efforts to ensure thorough cleaning and inspections were conducted on all assets in the sub-basin. Any assets not assessed will be re-visited in 2006.

3.2 Flow Monitoring and Modeling

Flow monitoring and modeling continue to be important tools to help KUB assess its system and prioritize basins for cleaning and rehabilitation. KUB added five permanent flow meters in 2005, bringing the total number of permanent flow meters strategically placed in the wastewater system to 30. KUB plans to continue to add permanent meters and use

temporary meters to collect data for the system model to help determine what areas to investigate and prioritize for future projects.

In 2005, KUB performed flow monitoring in the Second Creek, Lower Third Creek, Williams Creek, Loves Creek, and Eastbridge basins. Wastewater flows were monitored in each basin for approximately 60 days between late January and the end of April. KUB's contractor installed 102 temporary flow meters and 64 rain gauges for the study.

Flow monitors were placed at system connection points near trunk sewers and at other points identified by KUB to isolate and measure wastewater flows from individual sewersheds. Rainfall gauge locations were selected with the goal of obtaining comprehensive coverage of the basin. The study collected rainfall data to determine the relationship between rainfall volume and the rainfall dependent inflow and infiltration (RD I/I) volume. Data collected from this study will be used to support planning for both Gravity Line Preventive Maintenance, Pump Station and Force Main Preventive Maintenance, and Infrastructure Rehabilitation.

Of the basins studied, Second Creek had the most sub-basins with high RD I/I findings. KUB will schedule further evaluation, such as smoke testing and CCTV, for the Second Creek sub-basins and the others identified with RD I/I per linear foot values above 60 gal/lf. A sample map from the Second Creek basin is included in Appendix C.

3.3 Private Lateral Condition Assessment

Private laterals may also be a major source of RD I/I. Private lateral inspections currently follow PACE 10 wastewater system improvement projects. As part of the projects, KUB replaces the lower lateral (the portion from the sewer main to the cleanout) and installs a two-way cleanout. A contractor televises customers' upper laterals (the portion from the cleanout at the property line to the house) through the new cleanout and scores them using standard Pipeline Assessment and Certification Program (PACP) criteria. PACE 10 Program Manager CH2M Hill reviews the data and makes recommendations on repairs to the KUB Collection System Improvement Department (CSI). Smoke testing collected during inspection of the main lines also indicates private lateral problems such as downspout connections and other inflow sources.

From the launch of the mandatory PLP in August 2005 through December 2005, the contractor televised 415 laterals. KUB identified 114 of those as defective and notified the property owner to make repairs in 120 days or face water service termination. Forty-eight owners completed repairs by the end of 2005. For more information on the PLP, see Section 8.

3.4 Force Main and Pump Station Performance Assessment

As shown in the CSSAP table at the beginning of this section, KUB is committed to assessing all force mains and pump stations on a two-year cycle.

In 2005, KUB performed 429 routine facility inspections and 1781 scheduled preventive maintenance inspections. Appendix D includes maintenance activities and a schedule. Pump station maintenance crews also gather information for KUB consultant Camp, Dresser & McKee (CDM) for modeling purposes. Examples include the following:

- Performing 21 pump efficiency tests at various facilities
- Maintaining 10 flow meters to collect data from various facilities
- Pulling data from the Treatment Plant SCADA run-time database.

KUB's Force Main Condition Assessment Program identifies areas needing corrosion control and uses that information to schedule appropriate maintenance activities. Because steel, cast iron, and ductile iron pipe are susceptible to corrosion damage in areas where air is introduced, KUB is initially focusing assessment efforts around air-relief valves.

In July 2005, KUB started the process of mapping in the GIS all 164 air-relief valves on our force mains for the cleaning contractor. So far, 111 (68%) have been mapped and 76 have been inspected by the contractor. Appendix E contains an example inspection form.

Problems that arose when a developer buried the valves at one subdivision led KUB to establish a valve service box procedure. The box protects the valve and makes it easy to find and to access. It also helps avoid having to disturb homeowners' yards for maintenance work.

Manholes and lines downstream of low-pressure force mains are areas that may experience odor complaints. KUB concentrates hydrogen sulfide monitors and control efforts in areas like those.

Hydrogen sulfide control efforts help reduce odor and corrosion by preventing the formation of hydrogen sulfide. KUB currently feeds ferrous chloride, hydrogen peroxide, or sodium nitrate at 11 pump stations to control the formation of hydrogen sulfide. In 2006 another existing pump station and three new stations will begin using chemical feeds for corrosion and odor control. A chart of stations with chemical injection and odor-control is included in Appendix F.

In the past year, KUB worked closely with two different chemical suppliers to evaluate the effectiveness of their odor control and corrosion prevention products. The chemical products consisted of both liquid chemical feed as well as the addition of beneficial bacteria populations. The effectiveness of both pilot tests was analyzed using both wet chemical analysis and air monitoring of air release valve and force main discharge locations. Monitoring demonstrated that the addition of a magnesium nitrate compound coupled with the addition of beneficial bacteria populations significantly lowered the amount of hydrogen sulfide present in the force main. These two products are now in use at the Forks of the River pump station.

KUB also used caustic flushing to alleviate odor issues on the Forks of the River force main. The use of cleanout check valves has helped resolve odor complaints at five residences. Those techniques may also be options for other areas with odor complaints.

Consultant CDM also finished an odor control study for KUB in late 2005. The objective of the study was to evaluate the current odor and corrosion control program and make recommendations for improvements. The study included tasks to

- Assess KUB's current program, costs, coverage, and effectiveness

- Identify problem areas through review of KUB records, additional field investigations, and predictive modeling
- Develop a recommended sulfide control program including technology options and outsourcing options and an overall implementation plan.

The field monitoring program included vapor phase monitoring and wastewater sampling. KUB installed OdaLogs [by App-Tek International] at each selected force main discharge location and recorded the hydrogen sulfide concentration at five-minute intervals over 24 hours.

Liquid grab samples were collected to assess conditions contributing to sulfide formation in the force mains. Samples were collected at the pump station and at respective terminal manholes. The study sampled 14 pump stations of concern for corrosion and odor.

CDM used two models to look at the study data. The first was a simple force main equation. The second model was CDM's proprietary H2SWINS model.

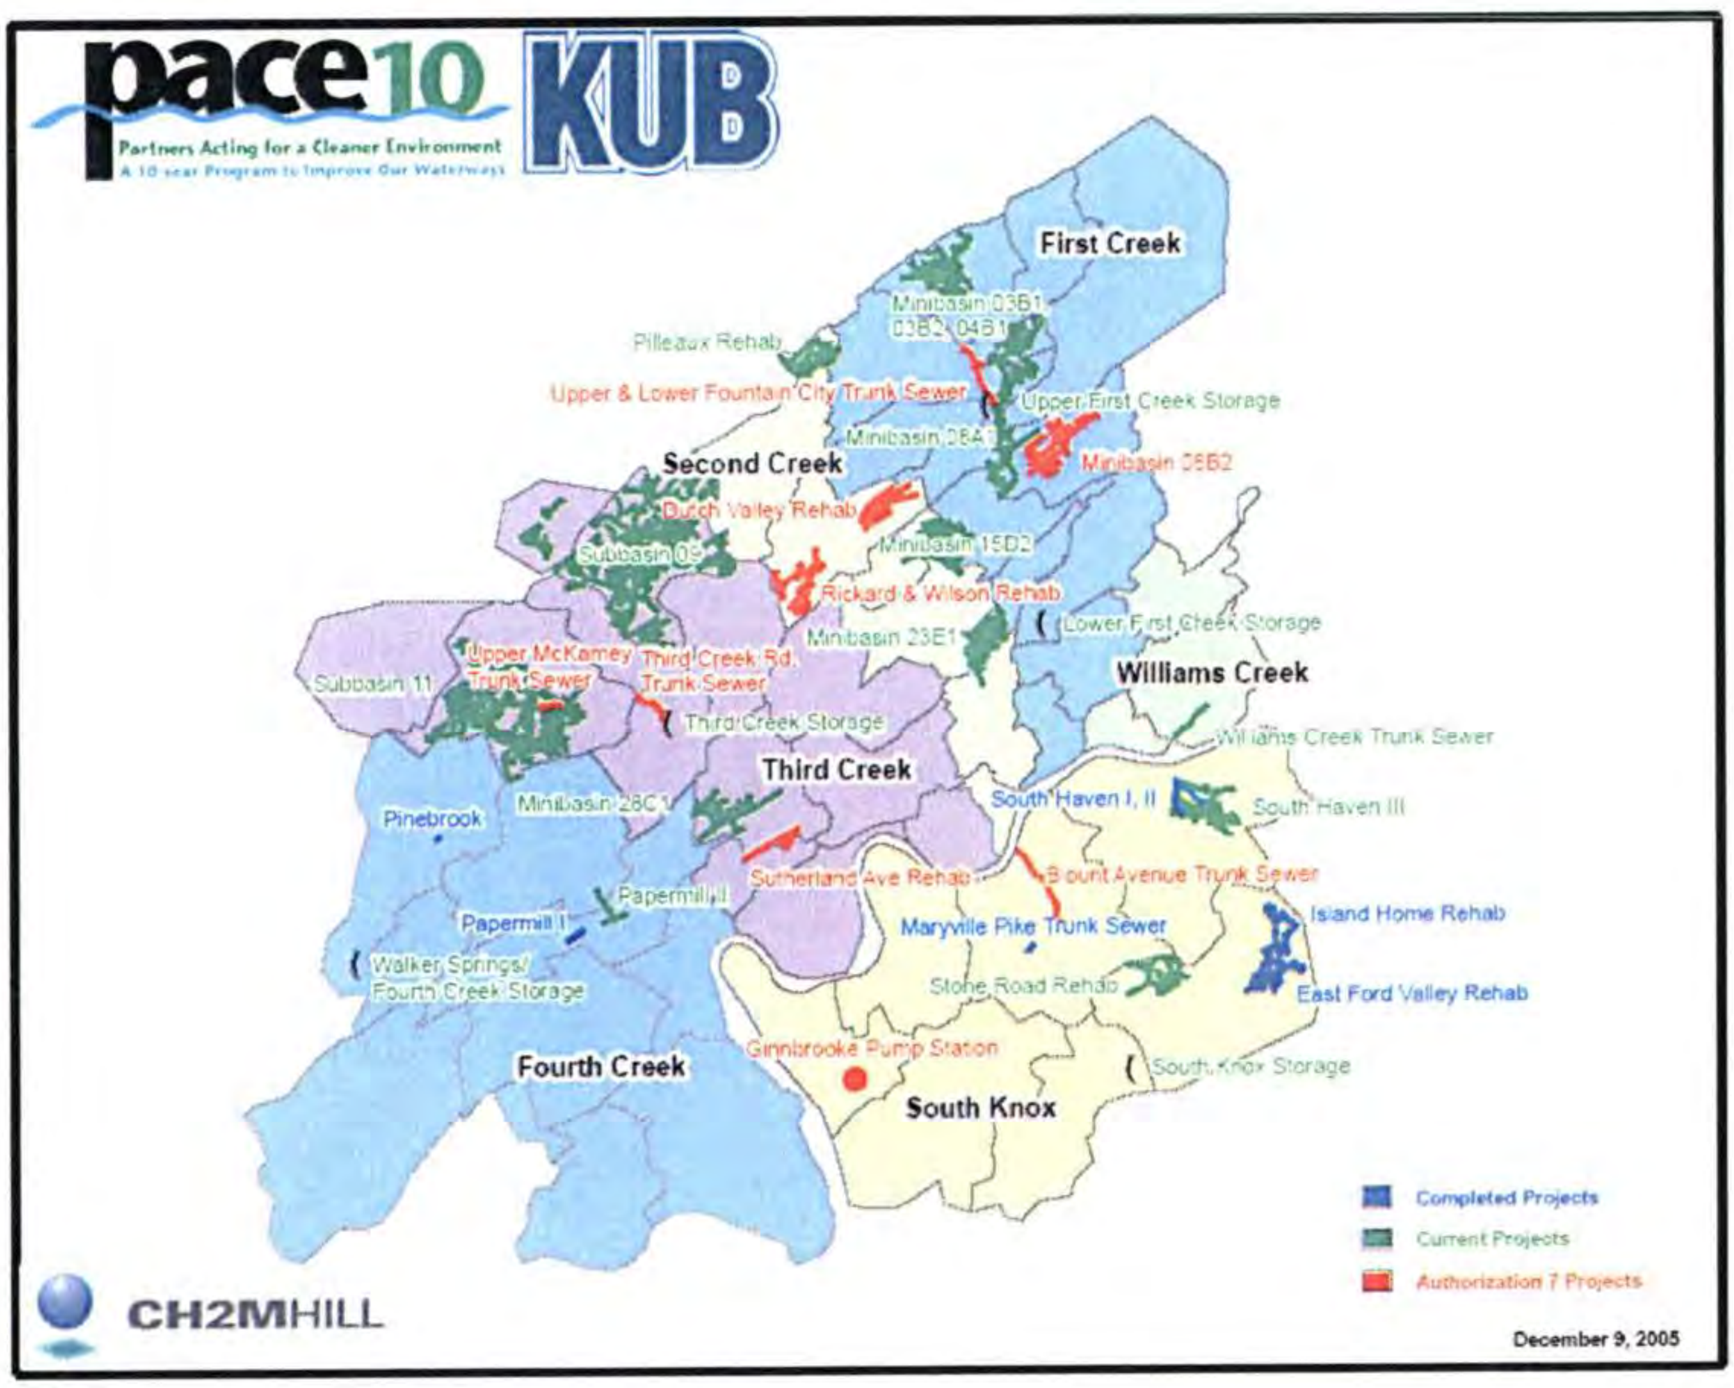
KUB will review the study results and CDM recommendations in early 2006.

Section 4: Infrastructure Rehabilitation Program (IRP)

The main objectives of the IRP are to address inflow and infiltration (I/I) and other causes of SSOs by maintaining or restoring capacity and structural integrity. It addresses both the gravity portion of the WCTS (gravity lines, manholes, etc.) and the transmission components (pump stations and force mains).

4.1 Gravity Lines and Manholes

KUB's IRP rehabilitated or replaced 145,044 linear feet (lf) of gravity sewer mains in 2005. That is about 2 percent of the KUB system, as shown by the map below. Out of 4206 manholes inspected, 452 were rehabilitated or replaced. The mains were rehabilitated or replaced using a mix of cured-in-place pipe, pipe bursting, or open-cut pipe replacement.



As part of PACE 10 wastewater system improvement projects, KUB also replaced approximately 1576 lower laterals and installed lateral cleanouts. KUB amended its standard in 2005 to specify a two-way cleanout to facilitate inspecting customer-owned upper laterals for the PLP. [*See Section 8 for more on the PLP*.] The Standards and Specifications for sewer laterals is included in Appendix G.

Post-rehabilitation/replacement flow monitoring is scheduled to start in February 2006 to evaluate the effectiveness of completed projects in removing I/I from the KUB system. Preliminary indications show those projects had an immediate impact on chronic overflow sites, several of which are experiencing fewer overflows.

The Fountain City rehab work, for example, has greatly minimized overflows near Fountain City Lake. Projects at Island Home and East Ford Valley are also showing results in decreasing overflows.

KUB initially focused heavily on flow monitoring and modeling to direct rehabilitation. As the IRP matures, KUB increasingly uses other components of the CSSAP, such as televising lines and inspecting pump stations, to direct improvements.

4.2 Basin Characterization: Key New Component of IRP

In 2005, KUB started working with the PACE 10 Program Manager on basin characterizations for approximately 600,000 linear feet of sanitary sewer in 25 sub-basins. The new approach represents a change from hot-spot driven reaction to more holistic planning.

The engineer and KUB Basin Owner puts information gathered in the CSSAP into a basin characterization spreadsheet. An example is included in Appendix H. The results include an assessment and recommended action for asset based on physical inspections, such as smoke testing and CCTV, as well as flow monitoring data gathered from previous studies. The analysis also considers hydrology of the area and potential for RD I/I.

The engineer looks at the basin as a whole and at individual lines and manholes that have problems and makes recommendations. The characterization becomes the preliminary design report for work in that basin. The design engineer and KUB Basin Owners discuss the recommendations, and KUB prioritizes and schedules projects to rehabilitate assets.

4.3 Pump Stations and Force Mains

Key performance criteria for pump stations and force mains are hydraulic capacity and structural integrity. Key criteria for pump stations are also mechanical and electrical reliability. KUB's ultimate goal is to upgrade pump station capacities as necessary to certify capacity for new connections in accordance with the requirements of the CAP.

In 2005, KUB added one new pump station [Ball Road] and started work on four new stations that will be operational in 2006. KUB also upgraded the channel grinder at Lyons Creek and installed a channel grinder at Holston Hills and a generator at Woodson Drive. Upgrades started at the Ginnbrooke, Harrison Keepe, and Millertown pump stations will be completed in 2006. Other 2005 facility and equipment work included upgrades at three metering facilities and SCADA upgrades and improvements at various facilities.

4.4 Information Management Systems Support the IRP

KUB continues to refine its wastewater system hydraulic model that was developed using physical attributes of the system (sewer size, slope, roughness, elevations relative to

grade, pump station capacities) and dry and wet weather flow conditions determined by analyzing flow monitoring. KUB uses new flow data to update and calibrate the model to ensure an accurate reflection of the system.

KUB captures information from investigation crews in the CSM Program, an electronic record-keeping tool. The CSM collects information for the proactive cleaning and assessment of the collections system and records trouble crew activities. All the information is tracked by the IPID number [unique KUB identifier], shown circled in red on the screenshots below. CSM screen shots used for recording information during an SSO response are included in Appendix I.

KUB uses CCTV information management software to record condition assessments. The software provides structured data input and ensures a uniform standard that facilitates office review. Each individual CCTV inspection consists of tabular inspection data, linked still photos, and digital videos. The Defect Listing Plot with Images shown below is an example of the output from the CCTV software. The PACP-certified software fully supports and conforms to PACP Standard Data Format export and/or import guidelines.

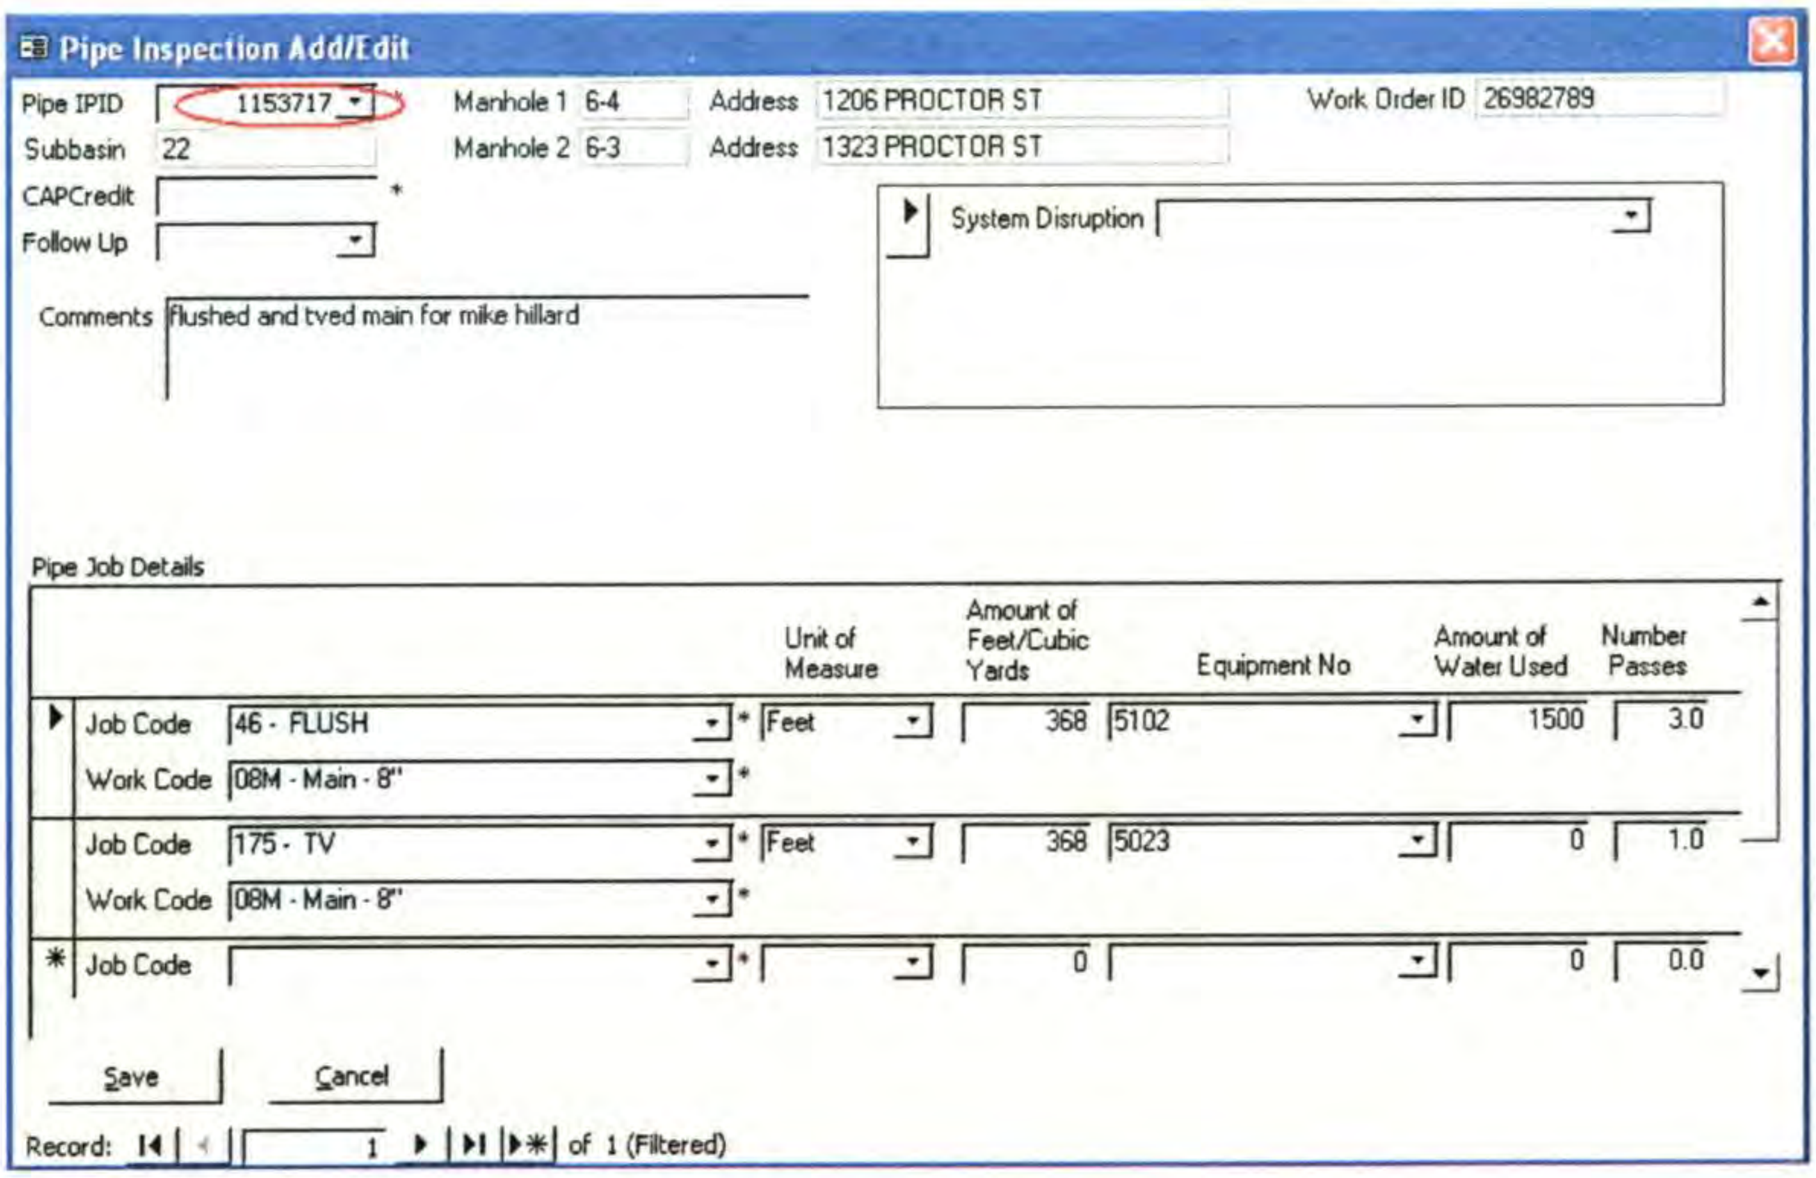
0001692



In 2005, KUB upgraded 400 internal licenses for Landviewer GIS viewing software as part of its participation in the Knoxville-Knox County-Knoxville Utilities Board Geographic Information System (GIS). The City and County are working on an upgrade to the GIS base data, which includes streets, parcels, aerial photos, etc.

The GIS is a valuable centralized database for system attribute data and collected information. Information from the IRP is stored in GIS tables to provide easy access to information by Basin Owners, Underground Construction (UGC) field crews, consultants, etc.

The GIS displays map data in layers: streets on one layer, parcels on another, houses on another, etc. That allows almost unlimited flexibility for viewing only the desired features and area. Non-graphic information is also associated with many map features and is stored in databases for immediate retrieval.

For example, users can acquire as-built numbers through GIS. With those numbers, users can quickly pull up the as-built through an Engineering directory database. KUB still plans to implement software to make it possible for users to pull up the as-built directly from the GIS.

Section 5: Gravity Line Preventive Maintenance Program (GLPMP)

The Gravity Line Preventive Maintenance Program (GLPMP) describes KUB's process for preventive cleaning of the wastewater system to improve operation, efficiency, and effectiveness. KUB is committed to cleaning the entire wastewater collection system in 12 years.

The GLPMP is divided into the Comprehensive Hydraulic Cleaning Program (CHCP) and BA Program. Root Control and Manhole Preventive Maintenance are components of both the BA and the CHCP. KUB determines chemical and mechanical root abatement frequency by the condition assessment program.

5.1 The Comprehensive Hydraulic Cleaning Program (CHCP)

The CHCP is a systematic, planned cleaning of the system to reduce debris and grease buildup and root intrusion. It is based on preventing and reducing the initial occurrence of system disruptions and maintaining the original hydraulic capacity of the collection system. It also provides support to the CSSAP by removing any obstruction in the system that would prevent a comprehensive inspection.

KUB, its basin cleaning contractors, and PACE 10 contractors cleaned 1,374,895 linear feet (lf) of gravity sewers in 2005 and televised 1,299,712 lf. That is 22 percent of the KUB gravity collection system cleaned and 21 percent televised. The footage listed in this category in general is unique, first time cleaning and inspection. The repeat work performed in the BA Program is not included in this count. A small percentage (< 2%) may be repeated due to rework or need for more rigorous cleaning. This will be reconciled in the 2006 review of MOM work performed.

5.2 The Blockage Abatement Program

The BA Program is a preventive maintenance approach for addressing operational issues. It uses previous event history and condition assessment information to implement activities that prevent or reduce system disruptions.

KUB outsourced BA efforts in 2004, allowing KUB crews to focus on systematic basin-by-basin cleaning. BA contract crews cleaned 747,138 linear feet (lf) and televised 170,877 lf of gravity sewers in 2005.

KUB adds a line segment to the BA Program when its cleaning frequency under the maintenance cycle proves insufficient to prevent overflows. Each line segment included in the BA Program is assigned a cleaning frequency more aggressive than it had under the maintenance cycle. The frequency of the maintenance activity ranges from one month to 42 months.

5.3 Root Control

Root intrusion into gravity sewer lines can significantly reduce transport capacity and lead to overflows. Roots alone can block sewer lines, and they can contribute to block-

ages by trapping debris and grease. To address this issue, KUB developed the Chemical Root Abatement Program to limit root intrusion and prevent significant capacity reductions and overflows.

Root intrusion occurs primarily along sewer lines within sewer easements. Line segments beneath roadways and other concrete or asphalt surfaces are typically far enough removed from nearby trees to limit root intrusion.

In the spring of 2005, KUB issued a contract for chemical root treatment of 285,000 feet of 8- to 15-inch pipe in four basins [1, 3, 8, and 40]. Contract cost was approximately $430,000. KUB sent letters to 1680 customers in Basin 40 and used doorhangers in the other basins [where PACE 10 work was already under way] to let them know the contractor would use EPA-approved chemicals that are odorless, non-toxic, non-flammable, and that will not harm trees or surface plants.

KUB also uses mechanical root abatement. Both KUB crews and the BA Program contractor have the capability to root cut lines as needed.

The Blockage Abatement Frequency Decision Tool helps the CSI Department determine the initial frequencies for BA line segments and review and modify existing frequencies. It includes influencing factors to help the decision-maker apply sound engineering judgment while considering the historical performance and the current condition of the wastewater system.

Basin owners use the Decision Tool to set the initial frequency for a line segment. That original frequency may be modified later [increased or decreased] based on several factors. KUB Hot Crews may make recommendations based on what they see in the field. The BA contractor who does the cleaning may also advise KUB on any needed changes in the schedule. For efficient and effective scheduling, KUB also considers the frequency schedule of other nearby pipes on BA.

KUB uses the factors in the following Decision Tool to assign and review maintenance frequencies:

Blockage Abatement Frequency Decision Tool	
Frequency (Months)	**Frequency Determining Factors**
1	• Extreme rate of blockage accumulation • Pending grease control enforcement action upstream • Upstream flow considerations – High Risk • Time between two SSO events less than three months

3	• High rate of blockage accumulation • Pending grease control enforcement action upstream • Time between two SSO events less than six months • Upstream flow considerations – Moderate to High Risk
6	• Medium rate of blockage accumulation • Pending grease control compliance action upstream • Upstream flow considerations • Require CCTV Follow-up before cleaning • Initial frequency following a blockage-related SSO • Time between two SSO events less than nine months
9	• Light rate of blockage accumulation • Pending grease control compliance action upstream • Upstream flow considerations • Time between two SSO events less than 12 months
12	• Slow rate of blockage accumulation • Pending grease control compliance action upstream • Upstream flow considerations • Time between two SSO events less than 18 months
18	• Slow rate of blockage accumulation • Pending grease control compliance action upstream • Upstream flow considerations • Time between two SSO events less than 24 months
24	• Slow rate of blockage accumulation • Pending grease control compliance action upstream • Upstream flow considerations • Time between two SSO events less than 36 months • Time span for initial chemical root abatement application
36	• Slow rate of blockage accumulation • Pending grease control compliance action upstream • Upstream flow considerations • Time between two SSO events less than 42 months • Large diameter pipe
42	• Slow rate of blockage accumulation • Pending grease control compliance action upstream • Upstream flow considerations • Time between two SSO events less than 144 months • Line segments upstream of siphons

Section 6: Sewer Overflow Response Plan (SORP)

As reported in the most recent SORP [revised and re-submitted to the U.S. EPA June 27, 2005, and approved July 28, 2005], KUB continues to place a high priority on maintaining and executing a Sewer Overflow Response Plan to help protect our community and our environment. KUB's Emergency Response Plan (ERP), which was approved by EPA on December 12, 2005, dovetails with the SORP. The ERP helps define the level of response that we take for everything from a single, isolated event to system-wide overflows.

KUB reviews the SORP annually. This progress report includes an update on implementation of recent revisions, training, and other areas of interest.

KUB makes all reasonable efforts [without endangering the safety of the responder or the public] to respond to an SSO within 45 minutes. The average response time, tracked using the CSM program since August, was 37 minutes. CSI is still working with UGC supervisors to help ensure crews log responses on their mobile data units promptly to provide an accurate measure of response time.

KUB relies on several measures to help maintain an appropriate quality of SSO response:

- Members of the CSI team, who are knowledgeable in SORP requirements, perform periodic quality assurance audits to evaluate how effectively the crew implemented the SORP. They look at a variety of factors, including containment measures, control zone and signs, and cleaning, and they check that crews followed the disinfection procedure. CSI works closely with crews and supervisors to maintain appropriate standards.
- Underground Construction supervisors monitor crews' work on a day-to-day basis. They also use on-site meetings in the field, coaching opportunities, and regular meetings to emphasize safety and maintaining proper standards. Compliance with established procedures is part of KUB's Performance Management Program measures and has an impact on employee ratings and raises.
- Feedback from customers, concerned citizens, neighborhood associations, City personnel, and organizations (such as the Izaak Walton League or Tennessee Clean Water Network) also helps identify any instances when the quality of response falters. Such feedback is directed to CSI, who works with UGC to correct the issue in that instance and prevent it from recurring in future responses.

Included in Appendix J are sample files detailing KUB's response to both an SSO and a Building Backup.

Safety of responders and of the public is a primary concern for KUB. During 2005, KUB crews responded to 1664 wastewater trouble calls [all calls, not just SSOs] with only one reportable injury incurred by a responder, according to KUB's Safety Department. Appropriate safety training is provided through the KUB Learning Center, and UGC conducts regular safety meetings and discusses safety frequently at tailgate meetings.

6.1 Public Information Program

KUB's SORP includes criteria for posting signs on "non-listed" streams during blockage-related overflows. "Non-listed" refers to streams that are not on the Clean Water Act Section 303d list. KUB periodically reviews the current 303d list and provides updated information to First Responders as it is available.

The first overflow that met the agreed criteria occurred December 16, 2005, at 1204 Woodcrest Drive, on an un-named tributary of First Creek. KUB posted overflow signs every 200 yards [for up to 1,000 yards] or at points of public access to help ensure appropriate public notice. The signs were posted for 48 hours after clean up was completed. KUB uses its standard sign for SSO postings in these instances.

KUB continues to post warning signs, along with yellow warning tape to establish a control zone, at all overflow locations. The KUB Web site also includes a log of SSOs events and safety tips on dealing with overflows.

6.2 SORP Training

In addition to working closely with all departments involved in the SORP on a day-to-day, event-by-event basis, CSI updates appropriate personnel as needed on revisions. After the revisions in June 2005, CSI provided updates on the new posting requirements for streams not on the 303d list and on building backups reporting.

CSI also conducts periodic SORP refresher courses. The last one was on December 15, 2005, for 35 Plant Operations personnel. Refreshers are also planned for UGC, Remote Sites, and Customer Support in early 2006.

In August and November 2005, CSI also conducted 2 classes on how to use the CSM for 14 UGC personnel.

6.3 Wet Weather Surveys

KUB continues to actively investigate sites with a history of overflows during heavy rain events. In 2005, responders made 319 proactive visits to various hot-spot sites after heavy rains. Each responder's truck has a hot-spot book and map, which is updated annually, for reference.

The decision on when to initiate such "windshield surveys" is based on customer notifications, weather, or experience of the CSI staff, UGC supervisors, or the First Responder on duty.

In 2005, KUB also added a tool to help alert responders when wet weather overflows are imminent: Manhole surcharge level sensors. When the level in manholes with a sensor reaches a set point, the sensor sends a page over a cellular system. The page notifies the KUB Operations Center, which dispatches a First Responder and sends an e-mail alert to

CSI. The sensor also sends a second page when the manhole level is back below the set point.

6.4 KUB Web Site

In 2005, KUB added a volume category to the SSO log and added a link to a permanent archive of SSOs by month. The SSO log link is prominently displayed under "Current Topics" on KUB's homepage. The archive includes the same information as the current SSO log: date, time, location, volume in gallons, and completed date.

Section 7: Other MOM Programs

KUB continues to implement and manage the Other MOM Programs in substantially the same manner as previously reported. The following is a brief update on some areas of particular interest or those where there have been changes:

- Sewer Mapping Program
  KUB has added BA information to GIS mapping. Users can view all lines that are in the BA, when they were last televised, cleaned, etc. All information is linked to a KUB IPID number, which is a unique identifier. An on-going Mapping goal is to develop and implement a process to ensure that all wastewater as-builts are completed and mapped into the GIS within three months of the wastewater facilities being placed into service.

- Sewer System Design Program
  KUB worked closely with PACE 10 Program Manager CH2M Hill to review and revise, as needed, KUB's standards and specifications for the Wastewater System. CH2M Hill reviewed existing standards and made recommendations for new construction pipe materials and appurtenances, rehabilitation materials, etc. The KUB Standards Team, which is made up of representatives from CSI, Engineering, Procurement, and System Operations reviewed all recommendations. CH2M Hill took review comments and compiled them into a General Program and Design Guidance document. When approved by KUB, this document will be adopted for all future wastewater system new construction and rehabilitation.

- Sewer Construction Inspection Program
  New sewer lines are air tested to check the integrity of all joints to ensure against infiltration and inflow of extraneous water. New manholes are vacuum tested for the same reasons.

  Testing of pipe bursting includes a visual inspection to ensure that the new pipe goes from manhole to manhole, and an air test is done as above for new sewers.

  Operational and performance testing of all pumping stations is conducted to verify capacity and functionality of all mechanical and electrical components.

- Rehabilitation Inspection Program
  Sewer lines rehabilitated with cured-in-place pipe (CIPP) are air tested to check the integrity of all joints to ensure against infiltration and inflow of extraneous water. CCTV is also used to ensure against liner wrinkles and defects. Sample coupons (small pieces of the installed CIPP) are collected from each CIPP installation and sent to independent labs to verify liner thickness and strength in compliance with specifications.

Rehabilitated manholes are vacuum tested to ensure against I/I of extraneous water. Visual inspections are also made on each manhole to check for staining that may indicate I/I at the frame and cover connection to the manhole itself.

Operational and performance testing of all pumping stations is conducted to verify capacity and functionality of all mechanical and electrical components.

- SSO Reporting, Notification, and Record-Keeping
  In August, 2005, KUB began reporting Building Back-Ups (BBUs) with similar protocols as the SSO reporting. BBU reporting includes the initial and final reports to TDEC. The only differences are that BBUs are not posted on KUB's Web site and are not summarized in the monthly SSO report submitted to TDEC with the Discharge Monitoring Reports.

- Equipment and Tools Management Programs
  In 2005, KUB purchased a new CCTV van and equipment and replaced the cameras for two other vans. The Grease Control Program also purchased a "Sludge Judge" core sample tool to help determine the effectiveness of grease traps.

- Complaint Management Program
  Customers have several avenues to reach KUB with wastewater questions or issues. Most questions and complaints are received from customers who call our Customer Information Center, which is staffed 24 hours a day, seven days a week. Other customers choose to e-mail KUB through the wastewater or customer service links on the KUB Web site. KUB continues to use its Customer Information System and Inservice software in trucks to facilitate response to complaints. In 2005, KUB responded to 1664 wastewater trouble calls. Some examples of the type of trouble calls received include odor complaints, stormwater concerns, and problem on property.

- Force Main Preventive Maintenance Programs
  KUB's Force Main Condition Assessment Program identifies areas needing corrosion control and uses that information to schedule appropriate maintenance activities. Because steel, cast iron, and ductile iron pipe are susceptible to corrosion damage in areas where air is introduced, KUB is initially focusing assessment efforts around air-relief valves.

  In July 2005, KUB started the process of mapping in the GIS all 164 air-relief valves on our force mains for the cleaning contractor. So far, 111 have been mapped and 76 have been flushed by the contractor. Appendix E contains an example inspection form.

  Odor-control efforts also help reduce corrosion by preventing the formation of hydrogen sulfide. KUB currently feeds ferrous chloride, hydrogen peroxide, or sodium nitrate at 11 pump stations to control odor. In 2006 another existing pump station and three new stations will use chemical feeds for odor control.

Section 8: Private Lateral Program (PLP)

As required by the Consent Decree, KUB must operate a mandatory PLP to help protect our environment by ensuring that property owners repair their laterals or remove prohibited connections, like roof downspouts or other sources of stormwater. Defective laterals or prohibited connections can overload KUB's sewer system with rainwater and contribute to sewer overflows. Leaking laterals can also add to pollution in area waterways.

KUB must take these steps as part of the PLP:

- Inspect customers' private laterals and identify defects or prohibited connections.
- Inform property owners of any defects, the process to follow for repairing or replacing laterals, and potential availability of financial aid.
- Ensure owners make lateral repairs or remove prohibited stormwater connections.
- Enforce the PLP by terminating water service to customers who do not make repairs within the 120-day timeframe.

Lateral inspections currently follow PACE 10 wastewater system improvement projects. As part of the improvement projects, KUB replaces the lower lateral (the portion from the sewer main to the cleanout) and installs a two-way cleanout at the homeowner's property line. A contractor televises customers' upper laterals (the portion from the cleanout at the property line to the house) through the new cleanout and scores defects using standard PACP criteria. PACE 10 Program Manager CH2M Hill reviews the data and makes recommendations on repairs to KUB CSI Department.

When defects or prohibited connections are identified, KUB sends letters notifying home-owners that they have 120 days to make repairs to avoid water service termination. The letters also include information about the defective lateral, the inspection and approval process, and funding available through the PACE 10 Residential Assistance Program.

KUB follows up with the customer several times (other mailings, phone calls, and visits, as needed) during the 120 days until the completed work is inspected and approved. KUB developed a Lotus Notes IMS, called the Private Lateral Tracker for the PLP. KUB shares the Tracker with the City of Knoxville, which must inspect and approve lateral repairs, and the Knoxville-Knox County Community Action Committee (CAC), which administers the financial aid portions of the PLP. Each agency has updating ability only for its own section on the Tracker, but each can view the others' pages. Screen shots from the Private Lateral Tracker are in Appendix K.

KUB tracks information on property ownership, enforcement notifications sent and scheduled, the appeal process, and other customer contacts. The City uses the IMS to record when an owner or plumber applies for a permit for a property in the PLP, the date of its inspection of the work, and whether the repair is approved. The CAC records infor-mation about grant and loan applications, cost estimates, plumbers doing the work, and disbursements for successfully completed work.

Low-income KUB wastewater customers who own their homes may be eligible for aid under the KUB Grant Program* or Loan Program. {**This project [Grant Program] was*

undertaken [by KUB] in connection with the settlement of a civil enforcement action taken by the United States for violations of the Clean Water Act.} To help those customers who can least afford the repairs, KUB also voluntarily funded a $2 million no-interest loan program for low-income customers.

The CAC administers both programs. CAC takes applications, qualifies applicants, schedules plumbers, updates KUB, and pays repair/replacement costs from program funds.

If a customer does not make repairs, KUB will stop water service and pull the water meter. KUB will also place a PLP alert on the account in the Customer Information System (CIS), so the water will not be turned back on until repairs are approved. When notified by a city inspector [or KUB inspector, for county laterals] that the work has been approved, KUB will remove the CIS alert, replace the meter, and reinstate service.

The following PLP statistics illustrate actions taken from the launch of the program in August 2005 through the end of this reporting period [December 2005]:

110 laterals identified for repair
112 Notices of Non-Compliance sent*
68 Notices of Violation sent
7 Notices of Termination sent
48 repairs completed
50 permits acquired for work
1 tenant-situation/30-day extension
0 appeals filed
0 enforcement actions
10 grant applications approved
1 loan application approved
*The two additional Notices of Non-Compliance were sent due to changes in ownership of the property.

Laterals that failed smoke testing were passed on to the contractor to be televised in small groups. That allowed time to refine the inspection and evaluation process, interaction between all parties involved, and communications to the customer before a more full-scale roll-out. That also means the 110 laterals identified were staggered over the five-month period, with customers at various points in the 120-day repair window.

Several customers came close to the cut-off deadline before making repairs, but to date none have missed the deadline and had their water service terminated. Although no appeals have been filed, KUB has used the discretion it was given to extend the time-frame 30 days in one tenant situation. [**Note**: That 30-day extension expired January 23, 2006. The customer did make repairs, and water service was not terminated.]

KUB also worked with a customer and the City Plumbing Inspector's office to test using pipe bursting for a lateral repair. Given that customer's circumstances, pipe bursting was more cost efficient than open cut replacement. The City Plumbing Board is considering whether to allow other customers to use the pipe bursting technique.

Pump Station
Maintenance Activities and Schedule

SMSP 2005

FACILTIY & EQUIPMENT UPGRADES

1. Millertown Lift Station upgrades – New development – To be complete 2006
2. Ginnbrooke Lift Station upgrades – New development – To be complete 2006
3. Emily Avenue Lift Station removal – To be complete 2006
4. Harrison Keepe Lift Station wetwell and piping upgrades – To be complete 2006
5. Holston Hills Lift Station channel grinder installation – Completed 2005
6. Woodson Drive Lift Station generator installation – Completed 2006
7. Lyons Creek channel grinder upgrades – Completed 2005
8. (3) Metering facility upgrades – Completed 2005
    - West Knox Meter, Gallaher View Meter, Downtown West Meter
9. SCADA upgrades and improvements at various facilities

NEW FACILITY INSTALLATIONS

1. Gazebo Lift Station – To be complete in 2006
2. Casa Bella Lift Station – To be complete in 2006
3. Whisper Ridge Lift Station – To be complete in 2006
4. Washington Pike Lift Station – To be complete in 2006
5. Ball Road Lift Station Installation – Completed 2005

SYSTEM STUDIES

1. KUB – CDM Odor / Corrosion control study
2. KUB – ICS Chemical trial at Forks of the River

FACILITY INSPECTIONS

1. 429 Routine facility inspections performed in 2005
2. 1781 Preventive Maintenance scheduled facility inspections performed in 2005

OUTSIDE SUPPORT

1. SMSP has performed 21 pump efficiency tests at various facilities and provided information to CDM for modeling purposes.
2. SMSP maintains 10 flow meters and uses these meters for various purposes. SMSP has provided CDM with flow meter data from various facilities for modeling purposes.
3. Treatment Plant SCADA maintains a run-time database for Wastewater Lift Stations. This information is pulled from the SMSP maintained SCADA system as it pertains to lift stations. Various facility run-time data has been provided to CDM for modeling purposes.

SMSP PM Procedure - SMSP002 – RSFAC (Wastewater facility inspection)

( ) 1. Check fence and grounds for security and clean area.

( ) 2. Check doors and locks for proper operation.

( ) 3. Check lighting inside and outside.

( ) 4. Check electrical panel lights.

( ) 5. Check operation of pumps and motors.

( ) 6. Check ventilation and heating systems.

( ) 7. Check dehumidifier operation.

( ) 8. Check sump pump and clean pit if needed.

( ) 9. Check generator:
   a. Oil and Fuel
   b. Coolant
   c. Battery
   d. Visually inspect hoses and belts

( ) 10. Check air compressors:
   a. Check oil
   b. Check filters
   c. Visually inspect belts
   d. Drain water from tank

( ) 11. Check screen room area:
   a. Check grinders
   b. Check screen and rake if needed
   c. Check channels and flush if needed
   d. Check wet well for grease and debris (report findings)
   e. Check gates and controls

( ) 12. Check odor control system:
   a. Pumps
   b. Leaks
   c. Levels in tanks (Document)

(__) 13. Safety equipment
   - Eyewash stations – check for proper operation
   - Emergency showers – check for proper operation

(Correct deficiencies as needed)

If any discrepancies are found, notify SMSP personnel.

Inspect the following stations twice each week.

Ginnebrooke	Holston Hills	Neubert Springs	Woodson Drive
Chapman Highway	Hanover	Sharps Ridge	
Cheowa	John Sevier	Shipetown	
Ford Valley	Jones Street	Smithland	
Forks of the River	Maloneyville	Walker Springs	

The frequencies to inspect these stations meet one or more of the following criteria.

a) Age of the station.
b) Operating history.
c) Size of the station and the amount of flow.
d) The potential for a negative environmental impact.

Appendix G

Standards and Specifications
Sewer Laterals

SECTION 02532
SANITARY SEWERS (GRAVITY)

2.3 SEWER LATERALS

A. Service laterals shall be replaced to the property line or easement line with minimum 6-inch PVC (SDR 26) service laterals with a minimum slope of 1-percent. Laterals shall be connected to new PVC piping with a PVC tee wye.

B. A new PVC clean out, double sweep tee (SDR 35, Manufactured by Plastic Trends Inc.) shall be provided at the right-of-way or easement line, and shall be set in a metal cleanout box (Dura-Coat cast Iron, Model Z1402 as manufactured by ZURN Industries). Transitions to 4 inch house lateral shall be made with a 6 inch by 4 inch PVC concentric reducer.

C. Service laterals connected to ductile iron pipe shall use ductile iron wyes with Protecto 401 ceramic epoxy lining.

D. Service laterals connected to CCFRPM (HOBAS) or GRP (Flowtite) pipe shall use an "Inserta-Tee" (Inserta Fittings Company).

E. Service laterals connected to CIPP mains shall be replaced with full saddle lateral connection to the liner. This method shall require removing the existing pipe one foot each side of the service lateral connection point to the sewer main to accommodate new service lateral connection.

F. Service lateral connections to pipe bursting (HDPE) mains shall be made with a HDPE electro-fusion saddle or for 15-inch or greater installations an "Inserta-Tee" (Inserta Fittings Company). This method shall require removing the existing burst pipe material one foot each side of the lateral connection point to the sewer main to accommodate new service lateral connection.

PART 3. EXECUTION

3.1 PIPE INSTALLATION

A. All pipe shall be installed in the presence of the OWNER. Do not begin the backfilling of trenches until the pipe in place has been visually inspected by the OWNER. Pipe installation shall begin at the lowest elevation, unless otherwise approved by the OWNER.

B. Before placing sewer pipe in position in the trench, carefully prepare the bottom and sides of the trench, and install any necessary bracing and sheeting as provided in Section 02321, Unclassified Excavation for Utilities.

C. Lasers shall be used to install sewer lines, and the type and procedures shall be approved by the OWNER. Reference points for both line and grade shall be set at each manhole. Where grades are 0.6% or less, check the elevation of the beam each 100 feet with an offset point or engineer's level.

D. Do not allow water to run or stand in the trench while pipe laying is in progress or before the trench has been backfilled. Do not at any time open up more trenches than the available pumping facilities are able to dewater.

E. Trench bottoms that are found to be unsuitable for foundations after pipe laying operations have started shall be corrected by bringing them to exact line and grade with material approved by the OWNER.

F. Carefully inspect each piece of pipe and special fitting before it is placed, and lay no defective pipe in the trench. Pipelaying shall proceed upgrade, starting at the lower end of the grade and with the bells upgrade. When pipe laying is not in progress, keep the ends of the pipe tightly closed with an approved temporary plug.

G. Excavation for bell holes shall be large enough to allow ample room for the pipe joints to be properly made. Excavate out bell holes no more than 2 joints ahead of the pipe laying. Carefully grade the bottom of the trench between bell holes so that each pipe barrel rests on a solid foundation as specified in Section 02321. Install each pipe with a close concentric joint to avoid sudden offsets or inequalities in the flow line.

H. As the work progresses thoroughly clean the interior of the pipe in place. After each line of pipe has been laid, carefully inspect it, and remove and, in accordance with all laws and regulations, dispose of all earth, trash, rags, and other foreign matter from its interior.

I. On new sewer lines install tee wyes in sewer lines to serve properly each lot adjoining the sewer and at such other locations as may be designated by the OWNER. If wyes are not to be used immediately, close them with approved plugs that are held in place to prevent infiltration and withstand all test requirements. On rehabilitated sewer lines provide connection to main per section 2.3.

J. If the work consists of constructing a new sewer to replace an existing one, connect existing laterals to the new line. Laterals which have been disconnected,

cut or abandoned shall be plugged and sealed with a backing block securing the plug.

K. New service laterals shall conform to the Standard Drawings herein.

L. For new laterals to be installed on existing sewer lines, a sewer saddle as specified in Part 2 above may be used in lieu of a tee section. The saddle shall be installed on a clean-cut, properly sized hole on the existing sewer, such that a watertight connection results. The cut in the existing pipe shall be made with a hole saw which retains the coupon. Sewer saddles shall not be used on vitrified clay pipe, or any other pipe deemed unsuitable for this method by the OWNER, unless approved by the OWNER.

M. Install new connections to existing manholes as specified in Section 02530, Manholes-Sewer. Reshape the bottom at the manhole as necessary to fit the invert of the sewer pipe.

N. Carefully protect from damage all existing sewers, water lines, gas lines, sidewalks, curbs, gutters, pavements, electrical lines, and other utilities or structures in the vicinity of the work at all times. If it is necessary to repair, remove, and/or replace any such utility or structure in order to complete the work properly, do so in compliance with the provisions set forth in other sections of these Specifications. Any such work shall be considered incidental to the construction of sewer mains.

O. Water service connections will be repaired or replaced in accordance with per KUB standards, by the CONTRACTOR at his expense as an incidental part of the work.

P. Service or house connections to existing sewers that are damaged or removed shall be repaired or replaced by the CONTRACTOR at his own expense as an incidental part of the work.

R. Wastewater flow must be maintained in the existing sewers. Whenever pipe-laying progresses to the point where this flow must be interrupted, the CONTRACTOR shall plug the sewer upstream of the construction and provide by-pass pumping to the downstream manhole. All downstream pipes, manholes and appurtenances must be tested and acceptable to the OWNER to receive wastewater flow. Discharging raw wastewater to natural waterways will not be permitted. The CONTRACTOR shall notify the OWNER prior to proceeding with by-pass pumping. When working in areas where interruption of wastewater flow may occur, the CONTRACTOR shall have lines and all other equipment in readiness at the site to provide by-pass pumping. A back-up pump and hose is required. CONTRACTOR will be liable for clean-ups, fines, and any other

problems that may occur. All equipment will be checked by OWNER for proper working conditions.

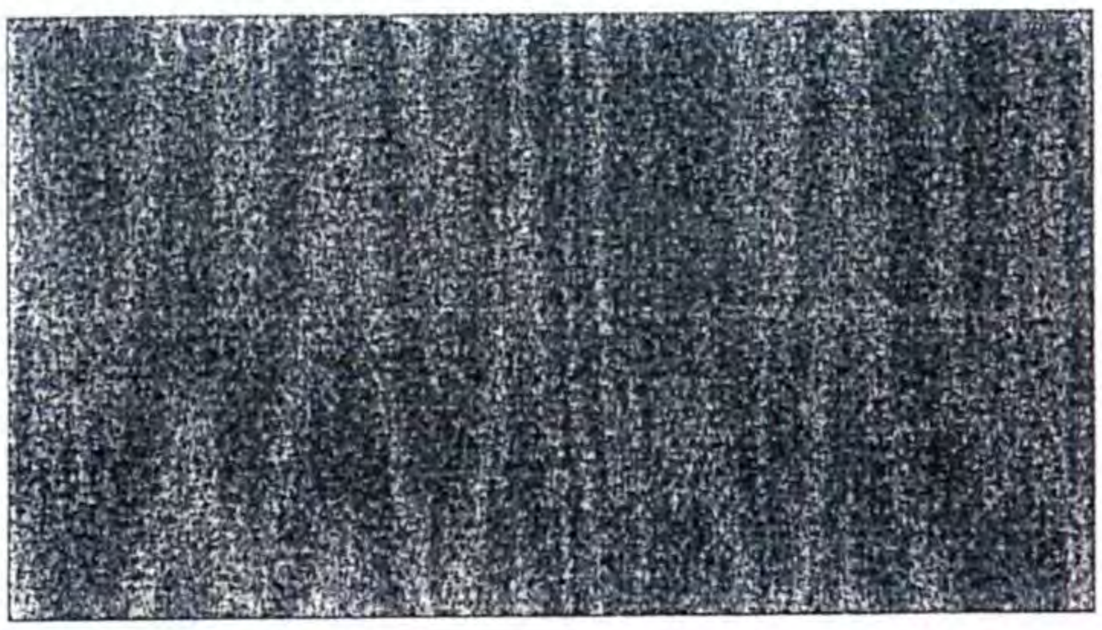
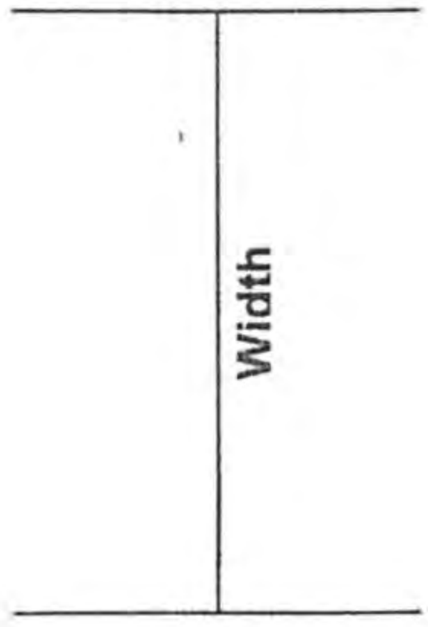
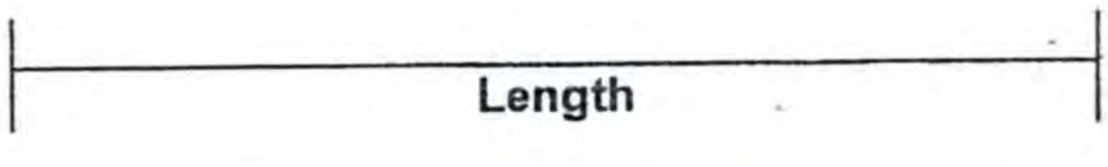
Volume Discharge Estimation

Calculating Rectangular Spill Areas







Date: 1-24-05 **Location:** 1839 Jenkins **Employee #:** 5309

Length of Spill (Ft): 10 ft *(1)*

Width of Spill (Ft): 10 ft *(2)*

Area of Spill (Sq. Ft) 100 *(3) = (1) x (2)*

Depth of Discharge (Feet): .5 *(4)*
Convert Inches to Feet by Dividing by 12

Estimated Volume of Discharge: 50 *(5) = (3) x (4)*

Convert Cubic Feet to Gallons: 374 *(6) = (5) x 7.48*

Report Estimate Discharge Volume: 374 *(6)*

Example

The approximate spill area is 100 feet by 50 feet and 6 inches deep. What is the Estimated Volume?

Length of Spill (Ft):	***100***	***(1)***
Width of Spill (Ft):	***50***	***(2)***
Area of Spill (Sq. Ft)	***5000***	***(3) = (1) x (2)***
Depth of Discharge (Feet):	***6/12 = 0.5***	***(4)***
Estimated Volume of Discharge:	***2500***	***(5) = (3) x (4)***
Convert Cubic Feet to Gallons:	***18,700***	***(6) = (5) x 7.48***
Report Estimate Discharge Volume:	***18,700 Gallons***	***(6)***

Subject Sanitary Sewer Overflow (SSO)
1711 Maple View Way

The following information is being provided to the Tennessee Department of Environment and Conservation (TDEC) in accordance with the requirements of KUB's NPDES Permits.

An SSO has occurred in the Kuwahee Collection System.

Date - January 24, 2005
Location - 1711 Maple View Way (Private Manhole)
Duration - 2 Hours
Est. Volume - 374 gallons
Reason - There was a partial blockage in the sewer main caused by debris.
Action Taken - The sewer main was flushed to clear the blockage. The area was cleaned.

Please call me @ 594-8210 or reply to this email if there are any questions.

Thank you,
Dwayne Frye, P. E.

Subject BBU - 2564 Woodbine Avenue

Date: December 5, 2005
Observer: David Lusby
Location: 2564 Woodbine Avenue
Reason: Notified by Dispatch that the main backed-up into basement of structure.
Action Taken: Contacted Servicemaster of the Smokies to clean, disinfect and dry the affected area.

KUB Responders: David Lusby, Risk Management

Estimated Volume: Area affected approximately 6' x 10'

Estimated Volume Not Recovered: Most of the water either drained back into the floor drains when the main was cleared or was extracted by Servicemaster of the Smokies. KUB's flush crew (Roger Llewelling) stated the main was stopped with grease.

Pictures from the affected area.

Subject Grease Investigation Report - 2564 Woodbine Ave. Building Back Up (BBU)

A BBU has occurred in the Kuwahee Collection System.

Date -	December 5, 2005
Time -	12:20 PM
Observer -	KUB Customer - Allene Bryant
Location -	2564 Woodbine Avenue
Reason -	There was a BBU caused by grease.
Action Taken -	The sewer main was flushed to clear the blockage. The building was cleaned.
KUB Responders -	David Lusby and Roger Lewelling
Est. Recovered Vol -	0 gallons
Est. Non-Recovered Vol. -	5 gallons
Duration -	1 Hour
Water of the State -	No
Receiving Water -	None
Photographs -	Copies of photographs are available upon request.

Follow-up SSO Investigation Report (Building Back Up (BBU)
Initial Investigation Date: December 12, 2005
Results: 45 residential and one commercial customer were identified as potential grease contributors from a building back up.
Identified Contributor: 45 residential and one commercial customer (Kreative Kids Daycare) were identified as potential grease contributors from a Landviewer query.
Comments: All residential customers will be mailed a grease can, magnet and brochure. I spoke with the Assistant Director (Ms. Lisa Mobley) of Kreative Kids Daycare about their current food prep practices. Ms. Mobley said that the daycare does a small amount of food prep but is well aware of not pouring grease down their drains. She said the daycare practices best management practices (BMPs) at all times.
